MongoDB Aggregation Examples

- Ensure you have pymongo installed before running cells in this notebook

```
import pymongo
from bson.json_util import dumps
import pprint

#  -->  Update the URI with your username and password <--

uri = "mongodb://mark:abc123@localhost:27017/"
client = pymongo.MongoClient(uri)
mflixdb = client.mflix
demodb = client.demodb
```

About Aggregates in PyMongo

- **Aggregation uses *pipelines*.**
- **A pipeline is a sequence of stages through which documents proceed.**
- **Some of the different stages that can be used are:**
  - **match**
  - **project**
  - **sort**
  - **limit**
  - **unwind**
  - **group**
  - **lookup**

$match

```
c = mflixdb.movies.aggregate([

    {"$match": {"year": {"$lte": 1920}}},

])
```

print(dumps(c, indent=4))

match and project

```
c = mflixdb.movies.aggregate([
    {"$match": {"year": {"$lte": 1920}}},
    {"$project": {"_id":0, "title": 1, "cast": 1}},
])

print(dumps(c, indent=4))
```

match project limit and sort

```
c = mflixdb.movies.aggregate([
    {"$match": {"year": {"$lte": 1920}}},
    {"$sort": {"title": 1}},
    {"$limit": 5},
    {"$project": {"_id":0, "title": 1, "cast": 1}},
])

print(dumps(c, indent=4))
```

Unwind

```
c = mflixdb.movies.aggregate([
    {"$match": {"year": {"$lte": 1920}}},
    {"$sort": {"imdb.rating": -1}},
    {"$limit": 5},
    {"$unwind": "$cast"},
    {"$project": {"_id":0, "title": 1, "cast": 1, "rating": "$imdb.rating"}},
])

print(dumps(c, indent=4))
```

Grouping

```
# What is the average IMDB rating of all movies by year? sort the data by year.

c = mflixdb.movies.aggregate([
    {"$group": {"_id": {"release year": "$year"}, "Avg Rating": {"$avg": "$imdb.rating"}}},
    {"$sort" : {"_id": 1}}

])
print(dumps(c, indent = 2))
```

What is the average IMDB rating of all movies by year? sort the data by avg rating in decreasing order.

```
c = mflixdb.movies.aggregate([
   {"$group": {"_id": {"release year": "$year"}, "Avg Rating": {"$avg": "$imdb.rating"}}},
   {"$sort" : {"Avg Rating": -1, "_id": 1}}

])
print(dumps(c, indent = 2))
```

Lookup

```
data = demodb.customers.aggregate([
   {
      "$lookup": {
         "from": "orders",
         "localField": "custid",
         "foreignField": "custid",
         "as": "orders"
      }
   },
   {"$project": {"_id": 0, "address": 0}}
])
print(dumps(data, indent = 2))
```

Reformatting Queries

```
match = {"$match": {"year": {"$lte": 1920}}}
limit = {"$limit": 5}
project = {"$project": {"_id":0, "title": 1, "cast": 1, "rating": "$imdb.rating"}}

agg = mflixdb.movies.aggregate([match, limit, project])
print(dumps(agg, indent=2))
```
